## 4 LAND UNIT DESCRIPTIONS

### 4.1 Land Unit Nomenclature

Approximately 155 land units have been mapped at the 1:40 000 scale across the Lake Eppalock Catchment. The land units are the basis for determining the threatening process susceptibility and water quality risks. Information for these land units has been derived predominantly from existing land study reports. The reports used in this study included Baxter and Boyle (1996), Bluml, Boyle and Jones (1995), Singleton and Lorimer (1992) and Lorimer and Schoknecht (1987).

The nomenclature used to describe the land units is based on the key attributes of the land unit namely landform element, soil type (order and sub-order according to Isbell (1996)), and a suffix to denote other unique distinguishing factors (Table 4.1). As an example, a land unit denoted dCab2 is a steep slope (landform element), Chromosol (soil type order), brown (soil type sub-order) and has other soil type features that distinguish it from a land unit denoted dCab1 (suffix).

**Table 4.1** Nomenclature used to describe the land units.

Landform element		Soil type: order <sup>1</sup>		Soil type: sub-order <sup>1</sup>		Suffix
a	Sharp crest	A	Anthroposols	aa	Red	1
b	Gentle (broad) crest	C	Chromosol	ab	Brown	2
c	Very steep slope	D	Dermosol	ac	Yellow	3
d	Steep slope	F	Ferrosol	ae	Black	
e	Moderately steep slope	H	Hydrosol			
f	Moderate slope	K	Kandosol			
g	Gentle slope	L	Calcarosol			
h	Very gentle slope	O	Organosol			
i	Drainage depression	P	Podosol			
j	Flat	R	Rudosol			
		S	Sodosol			
		T	Tenosol			
		U	Kurosol			
		V	Vertosol			

<sup>1</sup> Isbell (1996)

A map showing the spatial distribution of the land units is not part of this draft report due to the impracticality of displaying 155 units in a hardcopy map. In the final product, the map units will be available electronically.

### 4.2 Examples of Land Unit Descriptions

Information regarding the land units is also available electronically in the PDF format. An example of three land unit descriptions is presented in Table 4.2. The linkages between the water quality risks and planning directions have not been made, and will be based on consultation with local government and referral authorities.

**Table 4.2** Examples of three land unit descriptions proposed to be used in the final product.

Map Unit	aCab
<b>General Description</b>	
The soils on this map unit are generally similar to the gentle crest (Ose), although they are sometimes shallower. They occasionally have mottled subsoils, and A2 horizons with a clay loam to fine sandy clay loam texture. The slopes surrounding the crests are generally moderate to moderately steep. Depth of soil is variable	
<b>Unit Characteristics</b>	
Parent Material Age	Ordovician
Parent Material Lithology	Sedimentary
Landform Pattern	Rolling low hills
Landform Element	Sharp crest
Dominant Soil Type	Haplic, 7, Brown CHROMOSOL; medium, gravelly, clay loamy / clayey, shallow (confidence level 4)
Original Survey and Map Unit Symbol	A Land Capability Study of the Former Shire of Kyneton Osa

Water Quality Threatening Process Susceptibility				
Threatening Process	Water Erosion	Nutrient Leaching	Surface Solute Movement	Groundwater Recharge
Susceptibility	Moderate	High	Low	Moderate

**Rating Scales**

Water erosion	very low, low, moderate, high very high
Nutrient leaching:	low, moderate, high
Surface solute movement:	low, moderate, high
Groundwater recharge:	low, moderate, high

Land Use Water Quality Risk

Extractive industries	LOW	N/A	N/A	LOW	LOW

**Map Unit****aDad****General Description**

This map unit occurs as a ridge of metamorphosed sediments in the north-east of the shire. Shallow stony gradation soils are predominant, but very shallow stony loams and outcrops of bed-rock are common. The very narrow ridgeline has not been mapped separately from the steep slopes because of limitations of scale. Soils and vegetation are essentially the same, only the slope and the capability of slope-related land uses are different. The majority of the map unit remains uncleared and the fire hazard during the summer-autumn period is extreme.

**Unit Characteristics**

Parent Material Age	Ordovician
Parent Material Lithology	Sediments
Landform Pattern	Rolling hills
Landform Element	Sharp crest
Dominant Soil Type	Acidic, Dystrophic, Grey, Dermosol, moderate thin, loamy, gravelly
Original Survey and Map Unit Symbol	A Land Capability Study of the Shire of Newham & Woodend Osb

**Water Quality Threatening Process Susceptibility**

Threatening Process	Water Erosion	Nutrient Leaching	Surface Solute Movement	Groundwater Recharge
Susceptibility	Very high	High	Low	High

**Rating Scales**

Water erosion	very low, low, moderate, high very high
Nutrient leaching:	low, moderate, high
Surface solute movement:	low, moderate, high
Groundwater recharge:	low, moderate, high

**Land Use Water Quality Risk**

Land use	Water quality risk				
	Water erosion	Nutrient Leaching	Surface Solute Movement	Groundwater Recharge	Overall
<b>Broadacre grazing</b>	MODERATE - HIGH	MODERATE	LOW	HIGH	HIGH

**Map Unit** aFaa2

**General Description**

This map unit generally occurs as small narrow crests. Rock outcrop can occur on the surface or throughout the profile, and the percentage is variable. Gentle broad crests can occur that do not have a high percentage of rock outcrop, although they commonly have similar soils to the rocky crests. The soil profile is commonly composed of a clay loam topsoil and a clay subsoil. The soils are commonly red duplex or gradational. The gradational variant occurs when there is a transitional horizon between the A and B horizon.

**Unit Characteristics**

Parent Material Age	Quaternary
Parent Material Lithology	Volcanic
Landform Pattern	Lava Plain
Landform Element	Crest
Dominant Soil Type	Haplic, Eutrophic, Red FERROSOL; thick, slightly gravelly, clay loamy / clayey, very deep.
Original Survey and Map Unit Symbol	A Land Capability Study of the Former Shire of Kyneton Qve

**Water Quality Threatening Process Susceptibility**

Threatening Process	Water Erosion	Nutrient Leaching	Surface Solute Movement	Groundwater Recharge
Susceptibility	Moderate	High	Low	High

**Rating Scales**

Water erosion very low, low, moderate, high very high

Nutrient leaching: low, moderate, high

Surface solute movement: low, moderate, high

Groundwater recharge: low, moderate, high

**Land Use Water Quality Risk**

Land use	Water quality risk				
	Water erosion	Nutrient Leaching	Surface Solute Movement	Groundwater Recharge	Overall
Broadacre grazing	LOW	MODERATE	LOW	HIGH	MODERATE-HIGH
Intensive cropping (potatoes)	LOW - MODERATE	HIGH	LOW	N/A	MODERATE - HIGH
Intensive horticulture (viticulture)	LOW	MODERATE	LOW	MODERATE	MODERATE
Forestry establishment	LOW	N/A	N/A	N/A	LOW

## 6 GLOSSARY

Decision tree	Data analysis tool used to assess the water quality risk probability.		
Drainage			
Class	Value	Classification	
1	Very poorly drained	water is removed extremely slowly from the soil so the water table remains at or near surface for most of the year.	
2	Poorly drained	water table remains at or near surface for most of the year.	
3	Imperfectly drained	water is removed very slowly in relation to supply.	
4	Moderately well drained	water is removed from the soil somewhat slowly in relation to supply, due to low permeability, shallow watertable, lack of gradient, or some combination of these.	
5	Well drained	water is removed from the soil readily but not rapidly.	
6	Rapidly drained	water is removed from the soil rapidly in relation to supply.	
(Ref: McDonald, et al. 1990)			
Groundwater recharge	The action of surface water penetrating through the soil to the immediate or eventual contribution to the groundwater.		
Key land management factor	The main land management factor that impacts on the acceleration or reduction of the threatening processes.		
Land management critical value	The value at which a land management factor either accelerates or reduces a threatening process e.g. vegetation cover of greater than 70% reduces the water erosion threatening process in a broadacre grazing land use situation.		
Land management practice	Activities used to manage the land. Land management practices are a sub-set of a land use i.e. the cultivation land management practice within a cropping land use.		
Land management scenario	A perceived level of input or standard for the key land management factors developed for each land use and each land unit.		
Land unit	A land area showing a common landscape element or soil type that has been mapped at the 1:40 000 scale.		
Land use	The type of use that the land is put to.		
Overall water quality risk	The risk to the water quality after considering all of the threatening processes		
Nutrient leaching	Movement of dissolved nutrients through the soil with water movement.		

## Permeability

Class	Value	Permeability Range	Drainage Time
1	Very slowly permeable	less than 5 mm/day	months
2	Slowly permeable	5 - 50 mm/day	weeks
3	Moderately permeable	50 - 500 mm/day	days
4	Highly permeable	> 500 mm/day	hours

(Ref: McDonald, *et al.* 1990)

## Soil Orders (Isbell, 1996)

### *Calcarosols*

Are usually calcareous and therefore strongly alkaline throughout the profile, or directly below the topsoil. There is a gradual increase in clay down the profile.

### *Chromosols*

Have a light textured topsoil directly overlying a heavier (often clay) subsoil and a pH greater than 5.5 (water). They differ from Kurosols and Sodosols because they are not strongly acidic and are not sodic.

### *Dermosols*

Soils that have a gradual increase in clay down the profile. The subsoil is usually structured.

### *Ferrosols*

Soils that have a gradual increase in clay down the profile and have high amounts (>5%) of free iron oxide. They are commonly red and well structured.

### *Hydrosols*

Remain saturated for at least 2-3 months of the year. This may be caused by poor site drainage or by low soil permeability.

### *Kandosols*

Soils that have an gradual increase in clay down the profile. The subsoils are either hardsetting or only have very weak structure.

### *Kurosols*

Have a light textured topsoil directly overlying a heavier (often clay) subsoil. They differ from Sodosols and Chromosols because they are strongly acid (pH less than 5.5 in water) in the top of the subsoil.

### *Organosols*

Recognised for their dominance of organic materials, Organosols have more than 0.4 m of organic materials within the upper 0.8 m of the profile, or they may be organic on the surface and very little soil underneath.

### *Podosols*

Soils with an accumulation of compounds of organic matter, aluminium and/or iron within the subsoil. It often occurs as a cemented layer. Many older coastal sand dunes qualify as Podosols.

### *Rudosols*

Commonly these soils are shallow with very little soil development.

<i>Sodosols</i>	Have a light textured topsoil directly overlying a heavier (often clay) subsoil. They differ from Kurosols because they are not strongly acid. Their distinguishing feature is an Exchangeable Sodium Percentage (ESP) greater than 6% (known as sodic). That is there is a high exchangeable sodium in relation to other exchangeable cations. Sodosols often have impeded internal drainage due to poor structure as a result of the high exchangeable sodium.
<i>Tenosols</i>	These soils are either weakly developed or have a very weak structure in the subsoil. They differ from Rudosols because they usually have a more developed topsoil. They can range from soils with a developed topsoil directly overlying rock to deep sandy soils with little, if any structure.
<i>Vertosols</i>	Cracking clay soils.
Surface solute movement	Overland flow of water that carries in suspension (dissolved or not) bio-organics or soil.
Threatening process	One of four land degradation processes (erosion, nutrient leaching, surface solute movement or groundwater recharge) that deleteriously impact on water quality
Threatening process hazard	An assessment of a threatening process probability based on the threatening process susceptibility and rainfall extremes.
Threatening process susceptibility	The natural susceptibility of a threatening process to occur as dictated by climate, topography and soil type irrespective of land use and land management factors.
Threatening process water quality risk	The risk to water quality from a threatening process after assessing the impact of land use and land management on the threatening process hazard.
Water erosion	Is the deprivation of soil from a particular site due to its removal via water processes. Water flow is generally associated as the major cause of water erosion. Some of the major forms of water erosion include sheet, rill, gully, tunnel and stream bank.
